

Chosen Architecture Style - Component-Based Architecture

Explanation - The application uses Angular’s component-based architecture: the UI and logic are split into small, reusable components. Each component encapsulates its template, styles, and behavior; data flows via component state and bindings. The event-tracker component manages event data, input bindings, and display.

Justification - For a small, single-page app this style keeps code modular and easy to maintain: components map directly to UI parts, require minimal boilerplate, and allow quick testing and reuse. It also leverages Angular’s forms and dependency injection if the app grows.
