

Project Plan – Campus Event Tracker

Project Description - The Campus Event Tracker is a small single-page Angular application that lets organization members add simple events (title + date) and view the list of upcoming events. Events persist in the browser (localStorage) so users can return without losing data.

Project Scope (functional requirements) - Add a new event with title and date. - Display a list of saved events sorted by insertion order. - Persist events in the browser using localStorage and show a message when there are no events.

Task Breakdown & Estimation (Planning Poker) - 1) Create EventItem model (1 point) – add EventItem interface file. - 2) Create event-tracker component (3 points) – scaffold TS/HTML/SCSS and selector. - 3) UI layout and bindings (3 points) – template: inputs, Add button, list rendering, empty message. - 4) Implement TypeScript logic & persistence (5 points) – events: EventItem[], addEvent(), load/save to localStorage. - 5) Module wiring and forms support (2 points) – import FormsModule, declare component, add selector to AppComponent. - 6) Styling and polish (2 points) – basic CSS and accessibility tweaks, responsive layout. - 7) Create project plan & architecture docs (1 point) – write and export PDFs.

Notes on Estimates - Planning Poker values chosen: 1 (very small), 2 (small), 3 (medium), 5 (medium-large). - Total: 17 story points. For a single developer this is feasible in a focused 3–6 hour session depending on familiarity with Angular.
